

React JS

Source: Chai Aur Code

Instructor: Hitesh Choudhary

Notes: Araiz Naqvi

For my connections and me :)

Part 2

Lecture 2

Basic Requirements

- VS Code
- Node JS
- React Docs – react.dev

Running React

```
npx create-react-app 01ReactApp
```

The above can be done to create a basic react app however it takes time and data.

Hence instead we use a bundler like Vite.

```
npm create vite@latest  
-> Name of your React App  
-> React  
-> Javascript
```

This will take less time, however, we will still need to add the node modules folder. That is done as below:

```
npm install
```

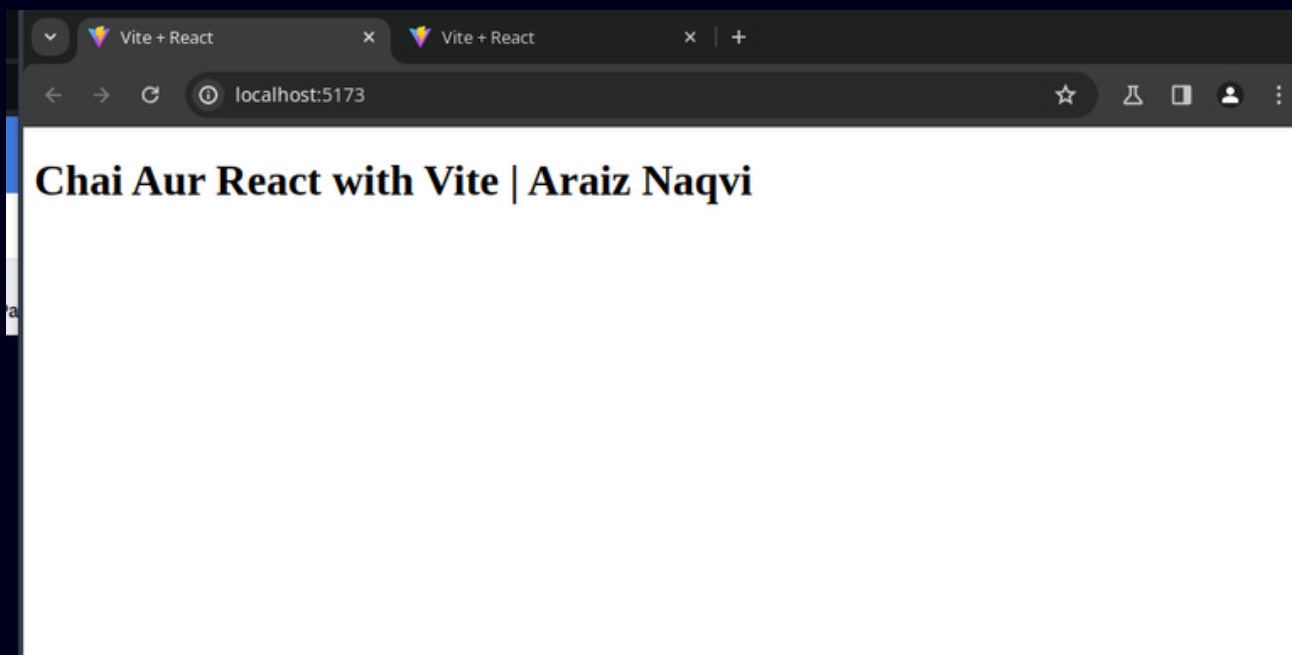

Finally you would've created a basic Vite React App.

Removing All Unnecessary Files

Remove all unnecessary css, js, and SVG files that we don't need right now.

`npm run dev`

The above holds the word 'dev' which in vite is part of a 'script' that helps us run the Vite React File.

Thanks
